

Inclusion by Division – When Boundaries turn No Man’s Land Into Some Man’s Land

Renato Regis

Short abstract

People constantly encounter visible boundaries, i.e. divisions in space. To date, research has focused on effects of such boundaries on individuals. Boundaries, however, are inherently related to social life, as they help define where one's space ends and another's begin. Personal space is a valuable possession. Consequently, people have the tendency to act territorially in order to protect it. This project highlights how the presence of boundaries may serve to include rather than exclude others, helping people within them to protect their space and people outside to identify and reduce empty spaces.
