

Modifying Order data

Transfer the following verbal description into a BPMN:

- In the case of order changes, work schedule changes or Malfunction/breakdown, the order data has to be modified by the Planning department.
- In the next step, the Planning Manager evaluates the order (based on the order & order changes) and may either decide in case of changing to divide tasks to clerks/persons in charge (based on personnel availability), or in case of new to redesign the whole order by the Planning employees.
- After his decision, the Planning Manager has to select a work schedule for both options. Then he has also to select a plant and decide on operations sequence (based on the work process).
- At the stage of deciding on the operations sequence, he has to define the work process and the work place group at the same time.
- Finally, the process ends with the order data being successfully modified.
