

Creating a Material Master

Source: [KeTe98, p. 500] © SAP, adapted by Farid El Masri, adjusted by Martin Roshkev

Transfer the following verbal description into an EPC:

- a) Prior to creating a material master, the product manager needs to specify the material type. Then the material number and the industry sector are determined in one step. A material number is assigned either externally or internally.
- b) The product manager then maintains the material master views "Sales & Distribution", "Purchasing", "Classification" and "Warehouse" and "Accounting".
- c) In the accounting view, valuation types are created by the product manager in case the split valuation is specified. Of course no valuation types are created if the split valuation is not specified. Finally, the material master is created.
